

# Metroborgo

Descriptive survey analysis  
Montalto delle Marche

---

Baseline survey · Residents and visitors questionnaire

# What this analysis measures

An initial snapshot of perceptions, a baseline for future comparison.

206

valid responses after the first filter question

83

residents / regular visitors analyzed

69

visitors analyzed after cleaning

Goal: understand how residents and visitors perceive Metroborgo today, while the interventions are still underway.

## Analyzed sample

Data split into two groups: residents/regular visitors and non-regular visitors.

Empty or test questionnaires excluded; partial responses kept when useful.

Descriptive indicators: frequencies, percentages, means, medians, and thematic areas.

This presentation uses non-technical language: each chart answers a simple question.

# Visitors: who they are and how they arrive

The sample is mostly young-adult, with short visits mainly for leisure.

Reading: Montalto is mainly reached for day trips. This helps explain why declared spending is mostly under €100.

Events matter, but they do not fully explain the visit: almost half attended an event, while the other half did not.

# Visitors: a positive experience, but not always “transformative”

The strongest areas concern wellbeing, return intention, sustainability, and the relationship with the territory.

Main result: the experience is pleasant, responsible, and encourages visitors to return.

Weak point: learning and active cultural involvement. The project works as an experience, less as an opportunity for deeper discovery.

1-7 scale

An average around 6 indicates a very favorable judgment; an average around 4 indicates a more uncertain or lukewarm position.

# Visitors: what works and what remains weaker

High satisfaction does not automatically mean learning and reflection.

Strengths (average)

The strengths are very concrete: respect, responsibility, wellbeing, and a positive feeling.

Weaker areas (average)

The weak points concern cultural content: understanding, learning, feeling involved, and reflecting.

# Visitors: low spending and still weak visibility

Day trips shape the declared economic contribution.

94.2% declare spending under €100. This is consistent with mainly day-trip tourism.

65.7% of visitors do not yet perceive an improvement in national or international visibility.

# Residents: a sample rooted in the territory

Most respondents have lived in or regularly visited Montalto since birth: the answers come from people with a long-standing connection.

# Residents: strong care for place, fragile collective dimension

Individual capital is high; community collaboration is the critical point.

Residents' perception by area (1-7 scale)

Strongest area: environmental responsibility. Residents report high attention to public spaces, the environment, and future consequences.

Weakest area: social cohesion and community. Mutual trust, collaboration, and sense of community receive the lowest scores.

Key message: attachment to Montalto is strong, but it does not yet fully translate into collective participation.

# Residents: strengths and critical issues

The highest scores are personal and environmental; the lowest are relational and community-based.

Responsibility toward the territory is a strong basis for building new participation practices.

The critical issue is not a lack of attachment, but the difficulty of turning it into trust and collaboration.

# Metroborgo according to residents: perceived effects

The most recognized effects are visibility, satisfaction, and environmental quality.

Perceived effects: positive share

79.3% think Metroborgo can foster new cultural, creative, and tourism businesses.

71.8% see an improvement in Montalto's visibility: residents are more positive than visitors on this point.

Social life and intercultural dialogue are more moderate: the project is not everywhere perceived as a fully achieved social driver.

# Economic aspects: selective signals, not widespread effects

Expectations are positive, but personal economic effects are still limited.

For 77%, income remained unchanged. 65.3% report unchanged property/asset value.

Only 12% report economic investments in the municipality. Among them, amounts are polarized: small investments and interventions over €100,000.

Cautious reading: rather than a widespread economic impact, the data suggest a phase of expectations and early concentrated signals.

# Residents and visitors do not see exactly the same thing

The project appears strong as a local experience, less strong as an external cultural narrative.

## Visitors

Positive and welcoming experience.

Wellbeing and return intention are very high.

Cultural learning and involvement are weak.

Montalto's visibility is not yet perceived by the majority.

## Residents

Strong attachment to the territory.

Very high environmental responsibility.

Cohesion, trust, and listening are critical issues.

Visibility and environmental quality are positively perceived effects.

**Key difference: residents perceive the project's visibility more clearly; visitors mainly perceive the quality of the experience.**

# Key takeaways

---

- 1 Metroborgo produces a positive perception of the experience: wellbeing, welcome, and return intention are strengths.
- 2 Deep cultural involvement is the main area for improvement, especially among visitors.
- 3 Residents are strongly attached to the place, but perceive low social cohesion and limited mutual trust.
- 4 Personal economic effects are still limited: the current phase is mainly one of expectations and early signals.
- 5 This survey is a baseline: its real value will come from comparison with data collected after the interventions are completed.
